Description

The IBM Personal Computer Color Printer is a tabletop, wire matrix, color printer. It attaches to the system unit's Printer Adapter or combination Monochrome Display and Printer Adapter through a standard printer cable, which has a 25-pin connector on the system unit end and a 36-pin connector on the printer end.

When the Color Printer is ready to accept data, the system unit sends the data and control codes through the printer cable to the printer's input/output (I/O) board. The I/O board directs the data and control codes to a buffer. The 6803 Microprocessor on the printer's controller circuit board monitors the buffer constantly and decides when and how to print the information based on the control codes.

The 6803 Microprocessor takes a character from the buffer and compares the character against a table to determine what dots to print. If the character is a control character, the microprocessor compares the character against a control-character table so that it knows what action to take.

When the 6803 Microprocessor reads a line-ending character, it determines whether it would be faster to move to the right margin and print backwards or to the left margin to begin printing. This ability, called *logic seeking*, allows faster printer output.

The following block diagram shows the operation of the IBM Personal Computer Color Printer.

Color Printer Block Diagram

Major Subsystems

The three major electromechanical subsystems of the printer are the I/O subsystem, controller subsystem, and print subsystem. Each subsystem is controlled by the 6803 Microprocessor mounted on the controller circuit board. The power-supply regulator circuits are an integrated portion of the controller card.

The I/O Subsystem

The I/O circuit board contains the circuits needed to direct the parallel data from the computer and interface cable to the printer's controller circuit board for processing. The I/O board also contains the circuits for directing operational status signals between the printer and the system unit.

Controller Subsystem

The controller subsystem consists of a 6803 Microprocessor and its peripheral interface and memory devices, which are mounted on the controller circuit board. The controller line buffer accepts data from the computer through the printer's I/O board. The controller decodes the data, then sends the data to the print subsystem for printing.

The controller also controls operation of the paper and ribbon feed. These circuits are activated by programming or by a function-select switch. Power regulation and distribution within the printer are also controlled by the controller board. The power regulator circuit, which is part of the controller circuit board, receives 5, 10, and 40 volts ac from the power supply transformer. It rectifies and distributes the different voltages to the various circuits and motors in the printer.

Print Subsystem

The print subsystem prints the data received from the controller. The subsystem consists of the following:

- Print head and carriage assembly
- Carriage drive motor and belt
- Left-margin sensor
- Paper feed assembly
- Ribbon drive assembly

The print head contains nine print wires. The print wires are staggered in two vertical columns with five wires in one column and four wires in the other. This arrangement is designed to allow overlapping of print dots. Selectively driving the wires against the ribbon and paper as the print head is moved across the platen, results in the printing of high-quality characters.

The print head is mounted on a carriage which is driven bidirectionally by the carriage drive stepper motor and drive belt. The left-margin sensor is used to signal the controller that the print head is at the home position.

4 Color Printer

The paper feed assembly is made up of a tractor assembly, paper stepper motor, and a paper-out sensor. It feeds the forms into position and holds the paper stationary while printing. Continuous forms are fed by pin belts in the tractor assembly, and single sheets of paper are fed by pressure rolls in the paper path. The pin belts and pressure rolls are driven by a drive shaft, drive belt, and the paper stepper motor.

The ribbon feed assembly drives the ribbon between the paper and the print head at a constant speed. It consists of a ribbon cartridge, ribbon drive motor, and a ribbon feed path made up of two rollers, two fixed posts, and a print-head ribbon guide. The ribbon cartridge contains a continuous loop of pre-inked 19-mm (3/4-in.) wide ribbon. The ribbon is pulled from the cartridge, around two guide posts, through the print-head ribbon guide, around two more ribbon posts, and "stuffed" back into the cartridge by two "stuffing" wheels.

In order to print different colors, the ribbon is shifted up and down by the color control mechanism, which is made up of a motor and cam assembly. The cam pivots the complete ribbon feed assembly to four different levels that match the four color bands on the ribbon.

6803 Microprocessor

The 6803 Microprocessor and its peripheral devices, which are mounted on the controller circuit board, direct all operations of the printer. This 8-bit single-chip microprocessor unit (MPU) functions as a monolithic MPU requiring one +5-Vdc power supply and is TTL-compatible. On-chip resources include parallel I/O and a three function programmable timer. Some of the other features include:

- Enhanced 6800 MPU instruction set
- 8 x 8 multiply instruction
- Upward-source and object-code compatibility with the 6800 MPU
- Expanded operation to 64K-byte address space
- 29 parallel I/O and 2-handshake control lines
- Internal clock generator with divide-by-4 output

The program-controlled operating mode determines the configuration of 18 of the 40 MPU pins available, location (internal or external) of interrupt vectors, and type of external bus. The configuration of the remaining 22 pins is not dependent on the operating mode.

Twenty nine pins are organized as three 8-bit ports and one 5-bit port. Each port consists of at least a data register and a write-only data-direction register. The data-direction register is used to define whether corresponding bits in the data register are configured as an input (clear) or output (set). When the port is used as a "data port" or "I/O port," it is controlled by the port data direction register and the programmer has direct access to the port pins using the port Data Register. Port pins are labeled as Pij, where "i" identifies one of four ports and "j" indicates the particular bit. The operating mode determines the configuration of Port 3, Port 4, SC1, SC2, and the physical location of the interrupt vectors.

The mode used by the 6803 MPU is called the Expanded Multiplexed mode. Expanded Multiplexed mode refers to the type of bus it supports. In this mode, Port 3 functions as a time-multiplexed address/data bus with address valid on the negative edge of Address Strobe (AS), and data valid while "E" (which is a timing signal), is high. Port 4 provides address lines A8 to A15.

8 Color Printer

Programming Considerations

Printer Control Codes

The following pages list, in alphabetic order, the printer control codes with a description of each. Some knowledge of BASIC programming is necessary to insert printer control codes in your program. An example of each code in BASIC is at the end of each description. The "Format" information is given where more information is needed for programming considerations.

Note: All combinations of printing qualities, character spacings, and types are valid. For example, you can print in emphasized print, double-width, and underline all at the same time.

The printer can accept parameters for the ESC commands in either of two formats:

- Binary
- ASCII Character

Although the default format is binary (as used in all examples in the "Printer Control Codes" section), the command, ESC @;n;, can be used to select either format.

This command affects only certain numeric parameters which follow ESC control codes. Parameters not affected by this command are those which select On or Off (1 or 0) because the Color Printer operates on only the least significant bit of n in these commands. Therefore, any odd-numbered ASCII decimal value gives the same result as n=1 and any even-numbered ASCII decimal value gives the same result as n=0. Parameters affected by this command are given in the following three examples:

1. A parameter defining numeric values.

In ASCII format these parameters must be stated as decimal characters, with each numeric field terminated with a non-numeric character (semicolon recommended). For example, to select the near letter quality type font, (ESC I3) the command is: LPRINT CHR\$(27); CHR\$(73);"3;";

In binary format the command is: LPRINT CHR\$(27); CHR\$(73); CHR\$(3);

2. A parameter defining lists of values ending in NUL.

In ASCII format these parameters must be stated as decimal numeric characters, with each numeric field terminated with a non-numeric character (semicolon recommended), with the final NUL being a second semicolon. For example, to set tabs at columns 10 and 40, (ESC D) the command is: LPRINT CHR\$(27); CHR\$(68);"10;40;;";

In binary format the command is: LPRINT CHR\$(27); CHR\$(68);CHR\$(10);CHR\$(40);CHR\$(0);

3. A two byte parameter (n1;n2;) defining the amount of data to be printed after the command.

In ASCII format this parameter must be sent as a single decimal numeric value (0 to XXXX) terminated with a non-numeric character (semicolon recommended). For example, to print twenty eight bytes in bit-image graphics, (ESC K) the command is: LPRINT CHR\$(27); CHR\$(75);"28;":FOR X = 1 TO 28: LPRINT CHR\$(255);: NEXT X

In binary format the command is: LPRINT CHR(27); CHR(75);CHR(28);CHR(0);: FOR X = 1 TO 28: LPRINT CHR(255);: NEXT X

| Printer Code | Printer Function |
|-----------------|--|
| BEL | Audible Alarm Sounds the printer buzzer for 1 second or less. The buzzer may be turned off with DIP Switch 8. Example: LPRINT CHR\$(7); |
| BS | Backspace Moves the print head one character width to the left. The character width is determined by the selected character spacing. Example: LPRINT CHR\$(8); |
| CAN | Clear Data Clears the printer memory of all data waiting to be printed following the last received line ending code. If the initialize function is set On by ESC ? (Set Initialize Signal Function), all control codes, except SO (Double-Width printing), remain in effect. If the initialize function is set Off by ESC ?, all control codes are cleared and the printer is set to the values set by the DIP switches. (See "ESC ?" for more details about the initialize function.) Example: LPRINT CHR\$(24); |
| CR | Carriage Return Causes the printer to print the data that follows CR beginning at the left margin. No line-feed operation takes place unless DIP Switch 4 is On or ESC 5 (automatic line-feed) has been sent. Note: IBM Personal Computer BASIC (and many other programs) automatically sends LF (line feed) with CR. If you do not want LF sent after CR, use ASCII decimal value 141 from Character Set 1 instead of ASCII decimal value 13. |
| DC1 | Example: LPRINT CHR\$(13); Select Printer Sets the printer to accept data from the system unit. Example: LPRINT CHR\$(17); |
| DC2 | 10 Characters per Inch Print Selects character spacing of 10 characters per inch. Example: LPRINT CHR\$(18); |

| Printer Code | Printer Function |
|-----------------|--|
| DC3 | Deselect Printer Sets the Color Printer so it will not accept data from the system unit. A printer must be initialized by the system or control panel buttons or selected using DC1 (Select Printer) to accept data. Example: LPRINT CHR\$(19); |
| DC4 | Cancel Double-Width Printing by Line Ends double-width printing by line which was started by SO. Example: LPRINT CHR\$(20); |
| ESC | Command Prefix Sets the printer to accept the next data sent as a printer command. (See the following list.) Example: LPRINT CHR\$(27); |
| ESC A | Store Text Line Spacing Format: ESC A;n; ESC A stores a line-feed value of n/72 inch. ESC 2 (Start Text Line Spacing) must then be sent before the line spacing will change. For example, to store a line-feed value of 24/72 inch, the code is ESC A 24. However, until ESC 2 is sent, any text following the ESC A 24 will space at the previously set line-feed increment. The text following the ESC 2 will be printed with a new line-feed increment of 24/72 inch. Any increment between 1/72 and 85/72 may be used. Example: LPRINT CHR\$(27);CHR\$(65);CHR\$(n); |
| ESC a | Select Automatic Ribbon-Band Shift Causes the ribbon to shift one color band at the end of each page. This command is used with an all-black ribbon to extend the ribbon life. Example: LPRINT CHR\$(27);CHR\$(97); |
| ESC B | Set Vertical Tabs Format: ESC $B;n_1;n_2;n_{64};NUL;$ Sets the vertical tab-stop positions. The power-on default is without vertical tab stops set. n_1 through n_{64} represent tab-stop positions by line number. The topmost line of the page is line 0. Tab-stop positions must be received in ascending numeric order and cannot exceed the set page length. Up to 64 positions are recognized by the Color Printer. The positions do not take effect until NUL is received. |

| Printer Code | Printer Function |
|-----------------|---|
| ESC B. Cont. | Once vertical tab stops are set, they remain in effect until new ones are specified or all tab stops are set to the power-on defaults by ESC R (Set All Tabs to Power-On Defaults). If no vertical tab stops are set, the Vertical Tab (VT) command behaves as a Line Feed (LF) command. ESC B followed only by NUL cancels all vertical tab stops. The form length must be set by the ESC C command (Set Page Length in Lines) prior to setting vertical tab stops. Example: LPRINT CHR\$(27);CHR\$(66);CHR\$(n ₁); CHR\$(n ₂);CHR\$(n ₆₄);CHR\$(0); |
| ESC b | Select Band 4 Selects ribbon band 4 (black). The printer will continue to print with band 4 until a command to change the ribbon band is received. Example: LPRINT CHR\$(27);CHR\$(98); |
| ESC C | Set Page Length in Lines Format: ESC C;n; Sets the page length in lines. The number of lines n is converted to inches using the current line spacing. ESC C must be followed by a value, n, that specifies the desired length of page in lines. Maximum page length for this printer is 127 lines. This command also sets the current position of the paper as the top-of-form. Note: Automatic perforation-skip (ESC N) and vertical tabs (ESC B) may need to be reset after changing the page length. |
| ESC C 0 | Example: LPRINT CHR\$(27);CHR\$(67);CHR\$(n); Set Page Length in Inches Format: ESC C;0;n; Sets the page length in inches. This command requires a value of n between 1 and 22. The power-on default is set with DIP Switch 6. This command also sets the current position of the paper as the top-of-form. |
| | Note: Automatic perforation-skip (ESC N) and vertical tabs (ESC B) may need to be reset after changing the page length. Example: LPRINT CHR\$(27);CHR\$(67);CHR\$(0); CHR\$(n); |

| Printer Code | Printer Function | |
|-----------------|--|---|
| ESC c | Select Band 3 Selects ribbon band 3. The actual color printed will depend on the ribbon being used. The printer will continue to print with band 3 until a command to change the ribbon band is received. Example: LPRINT CHR\$(27);CHR\$(99); | , |
| ESC D | Set Horizontal Tabs Format: ESC D;n ₁ ;n ₂ ;n ₂₈ ;NUL; Sets the horizontal tab-stop positions represented by n ₁ through n ₂₈ . The power-on default is a tab stop set at column 8 and every eighth column thereafter. The printer recognizes up to 28 horizontal tab stops. They must be in ascending numeric order and followed by NUL. Tab stops can be set between 1 and the maximum column count for the character spacing in effect. ESC D immediately followed by NUL will clear all horizontal tabs. ESC R (Set All Tabs to Power-On Defaults) may be used to set horizontal tabs to the power-on default. | |
| ESC d | Note: Setting a tab at column 0 clears all tabs and the following tabs will be considered data. Example: LPRINT CHR\$(27);CHR\$(68);CHR\$(n₁); CHR\$(n₂);CHR\$(n₂₈);CHR\$(0); Variable Forward Space Format: ESC d;n₁;n₂; Places the next printed character n₁;n₂/120 inch to the right of the last dot of the current character. The position may be beyond the right margin setting. If the position is beyond the physical end of the line, the next character will be printed at the left end of the printer. | , |
| ESC E | n₁ and n₂ are binary numbers that specify the number of 1/120-inch increments the next printed character is to be placed to the right. n₁ represents values from 0 to 255, and n₂ represents values from 0 to 255 times 256. Example: LPRINT CHR\$(27);CHR\$(100);CHR\$(n₁);CHR\$(n₂); Emphasized Printing Changes the printer to emphasized printing. Characters are double struck with the smallest possible horizontal offset between strikes. Example: LPRINT CHR\$(27);CHR\$(69); | |

| Printer Code | Printer Function |
|-----------------|---|
| ESC e | Variable BackspaceFormat: ESC e;n1;n2;Places the next printed character $n_1;n_2/120$ inch tothe left of the last dot of the current character. Theposition may be beyond the left margin setting. If thespecified position is beyond the physical left end of theprinter, the next character will be printed at the left endof the printer. n_1 and n_2 are binary numbers that specifythe number of $1/120$ -inch increments the next printedcharacter is to be placed to the left. n_1 representsvalues from 0 to 255, and n_2 represents valuesfrom 0 to 255 times 256.Example:LPRINT CHR\$(27);CHR\$(101);CHR\$(n_1);CHR\$(n_2); |
| ESC F | Cancel Emphasized Printing Ends emphasized printing started by ESC E. Example: LPRINT CHR\$(27);CHR\$(70); |
| ESC G | Double-Strike Printing Sets the printer to double-strike printing. Characters are struck twice with no horizontal offset between strikes. Example: LPRINT CHR\$(27);CHR\$(71); |
| ESC H | Cancel Double-Strike Printing Ends double-strike printing started by ESC G. Example: LPRINT CHR\$(27);CHR\$(72); |
| ESC I | Change Printing Quality Format ESC 1;n; Selects the printing quality. When n is 1, data processing quality is selected; when n is 2, text quality is selected; when n is 3, letter quality is selected. Each printing quality selection produces a different spacing of the dots that make up a character. Each character box is: with data-processing quality selected, 8 by 9 dots; with text quality selected, 24 by 9 dots; and with near-letter quality selected, 36 by 18 dots. Example: LPRINT CHR\$(27);CHR\$(73);CHR\$(n); |
| ESC J | Variable Line Space Format: ESC J;n; Advances the paper in increments of n/144 inch. The value of n must be between 1 and 255. Line spacing of 14/144 is recommended for bit-image graphics using eight bits. ESC J is canceled after the line space takes place. The value of n is not stored. Example: LPRINT CHR\$(27);CHR\$(74);CHR\$(n); |

| Printer Code | Printer Function |
|-----------------|--|
| ESC K | 1108 Bit-Image Graphics Format: ESC K;n1;n2;v1;v2;V1108; Sets dot spacing to 84 by 84 dots per inch in 1:1 aspect ratio, to 70 by 84 dots per inch in 5:6 aspect ratio (see ''ESC n (Set Aspect Ratio)''). All bit-image graphics is printed from left to right. If the graphics data exceeds the space remaining on the line, the data to be printed beyond the end of the line is printed at the left margin on the next line. |
| | n_1 and n_2 are binary numbers that specify the number of bit-image data bytes to be transferred. n_1 represents values from 0 to 255, and n_2 represents values from 0 to 4 times 256. The total number of bit-image data bytes is equal to $n_1 + n_2 \times 256$ and cannot exceed 1108 (the total number of dot positions in a 13.2 inch line). |
| | Bit-image graphics is printed using eight of the nine print-head wires (the bottom wire is not used). v_1 through v_{1108} are bit-image data bytes, each of which represents a set of 8 dots in a vertical line. The horizontal position of these 8 dots is determined by the position of the bit-image data byte within the v_1 through v_{1108} series. v_1 is printed at the starting position followed in order from left to right by v_2 through v_{1108} . Each bit of a bit-image data byte represents a vertical dot position at the horizontal position represented by that bit-image data byte. The lowest value, or least significant bit (Bit 0), represents the bottom dot position, and the highest value, or most significant bit (Bit 7), represents the top dot position. |
| | |
| | |
| | |

| Printer Code | Printer Function |
|-----------------|---|
| ESC K Cont. | In the following table the left-hand column of (•)s represents dot positions within a vertical line. The right-hand column shows the corresponding bit number within a bit-image data byte. (The bits are numbered 7 through 0, from left to right.) |
| | Dot Position Bit Number |
| | Top - 7 - 6 - 5 - 4 - 3 - 2 |
| | • - 2 • - 1 Bottom • - 0 |
| | For example: if v_1 is binary 10000000 (decimal 128), only the top dot prints in that horizontal position; if v_1 is binary 00000001 (decimal 01), only the bottom dot prints; and if v_1 is binary 11111111 (decimal 255), all eight dots print. |
| | Example: LPRINT CHR\$(27);CHR\$(75);CHR\$(n ₁); CHR\$(n ₂);CHR\$(v ₁);CHR\$(v ₂); CHR\$(v ₁₁₀₈); |
| ESC L | 2216 Bit-Image Graphics (half-speed) Format: ESC L;n ₁ ;n ₂ ;v ₁ ;v ₂ :v ₂₂₁₆ ; Sets dot spacing to 168 by 84 dots per inch in 1:1 aspect ratio, to 140 by 84 dots per inch in 5:6 aspect ratio (see "ESC n (Set Aspect Ratio)"). 2216 bit-image graphics (half-speed) prints at one-half the speed of 2216 bit-image graphics (ESC Y) for improved print quality and the ability to print consecutive dot positions. n ₁ , n ₂ , v ₁ , and v ₂ through v ₂₂₁₆ represent the same values as in 1108 bit-image graphics (ESC K). Refer to the description of ESC K for a complete description of these values. The total number of bit-image data bytes cannot exceed 2216 (the total number of dot positions in a 13.2-inch line). Example: LPRINT CHR\$(27);CHR\$(76);CHR\$(n ₁); CHR\$(n ₂);CHR\$(v ₁);CHR\$(v ₂); CHR\$(v ₂₂₁₆); |
| ESC M | Automatic Line Justification Format: ESC M;n; Justifies the right margin. Automatic justification is started when n is 1, and stopped when n is 0. The printer adjusts the spaces between words in the text so that the last character of the words at the end of the lines all print in the last position of the line. Thus both the left and right margins appear as straight lines. This gives a block appearance to the printed text. Automatic line justification can be used with any of the character spacings. |

| Printer Code | Printer Function | |
|-----------------|---|--|
| ESC M Cont. | Notes: 1. Lines are not right justified if the text is less than 75% of the specified line length. If a line fails the greater than 75% rule, the remaining portion of the text is tested. | |
| | If the justification results in a word wrap condition, the remaining text is treated as separate lines and follows the above rule. | |
| | 3. Control codes in the datastream cause the text before the control code to be printed based on the justification rules. The remainder of the text is justified between the current print position and the right margin. | |
| | If the last line of a paragraph, or any line of data, is not to be justified, use the control code sequence, backspace (BS) and carriage return (CR). | |
| | 5. The Color Printer operates only on the least significant bit of n. Therefore, any odd-numbered ASCII decimal value gives the same result as n=1, and any even-numbered ASCII decimal value gives the same result as n=0. | |
| | Example: LPRINT CHR\$(27);CHR\$(77);CHR\$(n); | |
| ESC m | Select Band 2 Selects ribbon band 2. The actual color printed depends on the ribbon being used. The printer will continue to print with band 2 until a command to change the ribbon band is received by the printer. Example: LPRINT CHR\$(27);CHR\$(109); | |
| ESC N | Set Automatic Perforation-Skip Format: ESC N;n; Specifies the number of lines to be skipped at the end of each page. This causes the printer to automatically skip over the perforation between pages of continuous forms. The number of lines n, is converted to inches using the line-spacing in effect. The value of n must be between 1 and 127. ESC N must be reset anytime the page length is changed by ESC C (Set Page Length in Lines) or by ESC C 0 (Set Page Length in Inches). Example: | |
| | LPRINT CHR\$(27);CHR\$(78);CHR\$(n); | |
| | | |

| Printer Code | Printer Function |
|-----------------|---|
| ESC n | Set Aspect Ratio Format: ESC n;x; Sets the printer to a 5:6 or 1:1 aspect ratio. When x is 1, the aspect ratio is set to 1:1; when x is 0, the aspect ratio is set to 5:6. With the 5:6 aspect ratio selected, graphics are printed to match the shape that appears on the display. The 1:1 aspect ratio is recommended for bit-image graphics to improve quality and simplify bit-position calculations. The power-on default is the 5:6 aspect ratio. Note: The Color Printer operates only on the least significant bit of n. Therefore, any odd-numbered ASCII decimal value gives the same result as n=1, and any even-numbered ASCII decimal value gives the same |
| | result as n=0. Example: LPRINT CHR\$(27);CHR\$(110);CHR\$(x); |
| ESC O | Cancel Automatic Perforation-Skip Cancels the automatic perforation-skip function. Example: LPRINT CHR\$(27);CHR\$(79); |
| ESC P | Proportional Spacing Format: ESC P;n; Starts proportional spacing when n is 1. Stops proportional spacing when n is 0. Proportional spacing gives each different character a different amount of space on the line. That is, narrow characters, such as i, are given a small amount of space on the line relative to a broader character, such as M. This is similar to the way people write characters and gives a more balanced look to the text. Many books are printed in proportional spacing, as is this one. |
| | The distance of a forward space is 10 units; the distance of a backspace is determined by the last printed character or space, if the printing of the character or the space was the last carriage movement. |
| | Normal processing of all control codes continues during proportional spacing. |
| | Note : The Color Printer operates only on the least significant bit of n. Therefore, any odd-numbered ASCII decimal value gives the same result as n=1, and any even-numbered ASCII decimal value gives the same result as n=0. |
| | Example: LPRINT CHR\$(27);CHR\$(80);CHR\$(n); |

| Printer Code | Printer Function | |
|-----------------|---|--|
| ESC Q 2 | Deselect Specific Printer Format: ESC Q;2; Sets only the Color Printer so it will not accept data from the system unit. The printer must be initialized by the system or selected using DC1 (Select Printer) to accept data. Example: LPRINT CHR\$(27);CHR\$(81);CHR\$(2); | |
| ESC R | Set All Tabs to Power-On Defaults Sets all tabs, horizontal and vertical, to the power-on defaults. Example: LPRINT CHR\$(27);CHR\$(82); | |
| ESC S | Subscript or Superscript Printing Format: ESC S;n; ESC S followed by 1 changes the printer to subscript printing. ESC S followed by 0 changes the printer to superscript printing. ESC S is canceled by ESC T. | |
| | Notes: 1. If line feed (LF) codes are issued while in subscript or superscript printing, the line feed does not change the subscript or superscript setting. For example, if in superscript printing, the line feed causes the paper to advance to the superscript position of the next line. | |
| | 2. The Color Printer operates only on the least significant bit of n. Therefore, any odd-numbered ASCII decimal value gives the same result as n=1, and any even-numbered ASCII decimal value gives the same result as n=0. | |
| | Example: LPRINT CHR\$(27);CHR\$(83);CHR\$(n); | |
| ESC SI | Compressed Printing Alternate command for SI. Example: LPRINT CHR\$(27);CHR\$(15); | |
| ESC SO | Double-Width Printing by Line Alternate command for SO. Example: LPRINT CHR\$(27);CHR\$(14); | |
| | | |

| | Printer Code | Printer Function |
|---|-----------------|---|
| | ESC T | Cancel Subscript or Superscript Ends subscript or superscript printing started by ESC S. |
| / | | Note: If ESC T is issued when not printing in subscript or superscript, it is acknowledged and ignored. |
| | | Example: LPRINT CHR\$(27);CHR\$(84); |
| | ESC U | Unidirectional Printing Format: ESC U;n; When n is 1, sets the printer to print from left to right only. ESC U 0 returns the printer to normal two-direction printing. Unidirectional printing ensures a more accurate printing start position for better print quality. |
| | | Note : The Color Printer operates only on the least significant bit of n. Therefore, any odd-numbered ASCII decimal value gives the same result as n=1, and any even-numbered ASCII decimal value gives the same result as n=0. |
| | | Example: LPRINT CHR\$(27);CHR\$(85);CHR\$(n); |
| | ESC W | Continuous Double-Width Printing Format: ESC W;n; ESC W 1 changes the printer to double-width printing. ESC W 0 ends the double-width printing started by ESC W 1. ESC W 1 is not canceled by a line ending code and must be canceled by ESC W 0. |
| | | Note: The Color Printer operates only on the least significant bit of n. Therefore, any odd-numbered ASCII decimal value gives the same result as n=1, and any even-numbered ASCII decimal value gives the same result as n=0. |
| | | Example: LPRINT CHR\$(27);CHR\$(87);CHR\$(n); |
| | | |
| | | |
| | | |
| | | |

| Printer Code | Printer Function |
|-----------------|---|
| ESC X | Set Left and Right Margins Format: ESC X;n1;n2; The numbers, n1 and n2, are selected in relation to the left side of the printer, with n1 representing the left margin and n2 the right margin. The value of n1 or n2 is the column of the page you wish to set as the left or right margin. n2 must be greater than n1 by 1.27 cm (1/2 inch) or more, and cannot be greater than 13.2 times the character-spacing (in characters per inch) in effect. If n2 is greater than this limit, the right margin will be set at the maximum allowable length. Data is printed beginning in column n1. Column n2 is considered the last printable position of the line. If a word to be printed exceeds the right margin, a carriage-return and line-feed are inserted before the word, and the word is printed on the next line. The margins are converted to inches based on the current character-spacing setting. The power-on default is set with DIP Switch 5. Note: Both n1 and n2 must be included in the command or the results will be unpredictable. |
| ESC Y | Example: LPRINT CHR\$(27);CHR\$(88);CHR\$(n ₁);CHR\$(n ₂); 2216 Bit-Image Graphics Format: ESC Y;n ₁ ;n ₂ ;v ₁ ;v ₂ ;v ₂₂₁₆ ; Sets dot spacing to 168 by 84 dots per inch in 1:1 aspect ratio, to 140 by 84 dots per inch in 5:6 aspect ratio (see "ESC n (Set Aspect Ratio)") and prints at normal printing speed. ESC Y graphics cannot print dots in consecutive horizontal dot positions. If consecutive dot positions are specified, the printer will not print the second dot. |
| ESC y | n₁, n₂, v₁, and v₂, through v₂₂₁₆ represent the same values as in 1108 Bit-Image Graphics (ESC K). Refer to the description of ESC K for a complete description of these values. The number of bit-image databytes cannot exceed 2216 (the total number of dot positions in a 13.2-inch line). Example: LPRINT CHR\$(27);CHR\$(89);CHR\$(n₁);CHR\$(n₂); CHR\$(v₁);CHR\$(v₂);CHR\$(v₂₂₁₆); Select Band 1 |
| | Selects ribbon band 1. The actual color printed depends on the ribbon being used. The printer will continue to print with band 1 until a command to change the ribbon band is received by the printer. Example: LPRINT CHR\$(27);CHR\$(121); |

| Printer Code | Printer Function |
|-----------------|---|
| ESC Z | 4432 Bit-Image Graphics Format: ESC Z;n ₁ ;n ₂ ;v ₁ ;v ₂ ;v ₄₄₃₂ ; Sets dot spacing to 336 by 84 dots per inch in 1:1 aspect ratio, to 280 by 84 dots per inch in 5:6 aspect ratio (see "ESC n (Set Aspect Ratio)"). 4432 bit-image graphics prints at one-half the speed of 1108 bit-image graphics (ESC K) for improved print quality. ESC Z graphics can print only every third consecutive horizontal dot position. If consecutive dot positions are specified, the printer will ignore the second and third dots. |
| | $ \begin{array}{l} n_2, v_1, v_2, \text{ and } v_{4432} \text{ represent the same} \\ \text{values as in 1108 bit-image graphics (ESC K). Refer to the} \\ \text{description of ESC K for a complete description of these} \\ \text{values. The number of bit-image databytes cannot exceed} \\ \text{4432 (the total number of dot positions in a 13.2-inch line).} \\ \text{Example:} \\ \text{LPRINT CHR$(27); CHR$(90); CHR$(n_1); CHR$(n_2); \\ CHR$(v_1); CHR$(v_2); CHR$(v_{4432}); \\ \end{array} $ |
| ESC 0 | 1/8 Inch Line Spacing Sets line spacing to 8 lines per inch. Example: LPRINT CHR\$(27);CHR\$(48); |
| ESC 1 | 6/72 Inch Line Spacing Sets line spacing to 6/72 inch. Example: LPRINT CHR\$(27);CHR\$(49); |
| ESC 2 | Start Text Line Spacing ESC 2 is an execution command for ESC A (Set Text Line Spacing). If no ESC A command has been given, line spacing returns to 6 lines per inch. Example: LPRINT CHR\$(27);CHR\$(50); |
| ESC 3 | Graphics Line Spacing Format: ESC 3;n; Sets line spacing to n/144 inch. Line spacing of 14/144 is recommended for bit-image graphics using eight bits. The value of n must be between 1 and 255. Example: LPRINT CHR\$(27);CHR\$(51);CHR\$(n); |
| ESC 4 | Set Top of Page Sets the current vertical position as the top-of-page. Example: LPRINT CHR\$(27);CHR\$(52); |

| Printer Code | Printer Function |
|-----------------|--|
| ESC 5 | Automatic Line Feed Format: ESC 5;n; When n is 1, automatic line feeding starts; the printer will line-feed each time a code that indicates the end of a line, such as CR, is received. When n is 0, automatic line feeding stops. Note: The Color Printer operates only on the least significant bit of n. Therefore, any odd-numbered ASCII decimal value gives the same result as n=1, and any even-numbered ASCII decimal value gives the same result as n=0. |
| | Example: LPRINT CHR\$(27);CHR\$(53);CHR\$(n); |
| ESC 6 | Select Character Set 2 Selects character set 2. (See "Character Set 2.") Character Set 2 contains most characters and symbols used in non-English languages. The power-on default for Character Set is set with DIP Switch 1. |
| | Note : Some programs use the control codes in Character Set 1 that have ASCII decimal values above 128. These control codes are not in Character Set 2. The use of Character Set 2, therefore, may not give the desired results with some programs. |
| | Example: LPRINT CHR\$(27);CHR\$(54); |
| ESC 7 | Select Character Set 1 Selects character set 1. (See "Character Set 1".) Character Set 1 contains characters and symbols commonly used in the English language, along with some common, non-English, characters and symbols. The power-on default for Character Set is set with DIP Switch 1. Example: LPRINT CHR\$(27);CHR\$(55); |
| ESC – | Continuous Underline Format: ESC –;n; When n is 1-all of the following data is underlined. ESC – followed by 0 cancels underlining. |
| | Note: The Color Printer operates only on the least significant bit of n. Therefore, any odd-numbered ASCII decimal value gives the same result as n=1, and any even-numbered ASCII decimal value gives the same result as n=0. |
| | Example: LPRINT CHR\$(27);CHR\$(45);CHR\$(n); |

| Printer Function |
|--|
| 12 Characters per Inch Printing Sets character spacing to 12 characters per inch. Example: LPRINT CHR\$(27);CHR\$(58); |
| Move Carriage to Home Position Returns the print head to the left side of the printer to print the line following the command. No line feed occurs. Example: LPRINT CHR\$(27);CHR\$(60); |
| Set Initialize Signal Function Format: ESC 7;n; Defines what the printer does when an initialize signal is received. The initialize signal is a hardware signal sent to the printer by the system unit when called for by the program being used. This signal is commonly called for when a program is first loaded. When n is 1, the initialize function is set On; when n is 0, the initialize function is set Off. When the initialize function is On, the initialize signal causes the printer to clear all data from the printer memory and set all printer functions to the power-on defaults. Some of the data may not have been printed and will be lost. When the initialize function is Off, the initialize signal causes the printer to insert CAN (Clear Data) into the data in the printer memory. The CAN, when processed by the printer, clears the printer memory of all data waiting to be printed following the-last received line-ending code. All control codes are cleared and the printer is set to the values set by the DIP switches. This allows a printing job to be completed before the printer is reset for the next application. The power-on default is the initialize function set Off. Note: The Color Printer operates only on the least significant bit of n. Therefore, any odd-numbered ASCII decimal value gives the same result as n=1, and any even-numbered ASCII decimal value gives the same result as n=0. Example: LPRINT CHR\$(27);CHR\$(63);CHR\$(n); |
| |

| Printer Code | Printer Function | |
|-----------------|---|--|
| ESC @ | Select Control-Value Data Type Format: ESC @;n; Allows the printer to accept certain parameters for the ESC commands in either of two forms: binary or ASCII character. When ''n' is 1 (odd) ASCII is selected. When ''n'' is 0 (even) Binary is selected. | |
| | Note: See "Programming Considerations at the Beginning of this section for a detailed explanation of this command. | |
| | Example: LPRINT CHR\$(27);CHR\$(64);CHR\$(n); | |
| ESC \ | Print All Characters Format: ESC $\langle ;n_1;n_2;$ Allows the printing of all characters. This includes characters that are normally recognized by the printer as control codes. This code (ESC $\langle \rangle$) allows the printer to print the special symbols assigned to these ASCII values. If no character is assigned to a decimal value received by the printer, a space character is printed. No control code functions are performed when this command is in effect. n_1 and n_2 are binary numbers that specify the number of characters to be printed. n_1 represents values from 0 to 255, and n_2 represents values from 0 to 255 times 256. Example: LPRINT CHR\$(27);CHR\$(92); CHR\$(n_1);CHR\$(n_2); | |
| ESC] | Reverse Line Feed Causes the printer to move the paper down one line space as defined by DIP Switch 2 or by printer control codes, ESC A and ESC 2, ESC 0, ESC 1, or ESC 3. Example: LPRINT CHR\$(27);CHR\$(93); | |
| ESC ^ | Print Any Character Allows the printer to print any character each time the command is received. This includes characters normally recognized by the printer as control codes. This code (ESC \land) allows the printer to print the special symbols assigned to these ASCII values. If no character is assigned to a decimal value received by the printer, a space character is printed. Example: LPRINT CHR\$(27);CHR\$(94); | |
| | | |

| Printer Code | Printer Function |
|-----------------|--|
| FF | Form Feed Advances the paper to the next top-of-form position. The top-of-form position is set by the position of the paper when power is switched On, or by ESC 4, ESC C, or the control-panel buttons. The next top-of-form is determined by the form length defined by DIP Switch 6, ESC C, or ESC C 0. Example: LPRINT CHR\$(12); |
| нт | Horizontal Tab Moves the print head to the next horizontal tab stop. If the next horizontal tab stop is beyond the right margin, the character following HT is printed at the left margin. Tab stops are set with ESC D. A tab stop every 8 columns is the power-on default. Example: LPRINT CHR\$(9); |
| LF | Line Feed Advances the paper one linespace, as defined by DIP Switch 2 or by printer control codes; ESC A and ESC 2, ESC 0, ESC 1, or ESC 3. Example: LPRINT CHR\$(10); |
| NUL | Command End Used with control commands as a command list terminator. NUL is also used with other printer control codes to select options. Example: LPRINT CHR\$(0); |
| SI | Compressed Printing Causes the printer to begin compressed printing. Character spacing in compressed printing is 17.1 characters per inch. Example: LPRINT CHR\$(15); |
| SO | Double-Width Printing by Line Causes the printer to start double-width printing. Double-width printing prints the characters twice as wide as the current character spacing. This results in half as many characters per inch. A Carriage Return, Line Feed or DC4 (End Double-Width Printing by Line) cancels the SO command. Example: LPRINT CHR\$(14); |
| | |

| Printer Code | Printer Function | |
|-----------------|---|--|
| VT | Vertical Tab Advances the paper to the next vertical tab-stop position. If the next vertical tabstop is beyond the bottom of the page, the paper is placed at the first line of the next page. If no vertical tab stops are set, the VT command is treated as a line-feed (LF) command. Example: LPRINT CHR\$(11); | |

Printer Control Code Quick Reference

This is an alphabetic listing of the descriptions of the printer control codes. You will find it helpful in locating the code you need to perform a certain job, or to determine the ASCII decimal value quickly, once you are familiar with the control codes.

Note: ASCII values greater than 27 must be preceded by the ESC code (ASCII value 27).

| Description | Code | ASCII Value |
|--------------------------------|-------|----------------|
| 10 characters-per-inch print | DC2 | 18 |
| 12 characters-per-inch print | ESC : | 58 |
| 17.1 characters-per-inch print | SI | 15 |
| Alarm | BEL | 7 |
| All-characters print | ESC \ | 92 |
| Aspect ratio set | ESC n | 110 |
| Audible alarm | BEL | 7 |
| Auto justification On/Off | ESC M | 77 |
| Auto line feed On/Off | ESC 5 | 53 |
| Auto perforation skip Off | ESC O | 79 |
| Auto perforation skip On | ESC N | 78 |
| Auto ribbon-band shift | ESC a | 97 |
| Auto ribbon shift | ESC a | 97 |
| Backspace | BS | 8 |
| Backspace n increments | ESC e | 101 |
| Backspace variable | ESC e | 101 |
| Band 1 | ESC y | 121 |
| Band 2 | ESC m | 109 |
| Band 3 | ESC c | 99 |
| Band 4 | ESC b | 98 |
| Bell | BEL | 7 |
| Black ribbon band | ESC b | 98 |
| Buzzer | BEL | 7 |
| | | |

| Description | Code | ASCII Value |
|--------------------------------------|-------|----------------|
| Cancel | CAN | 24 |
| Cancel auto line feed | ESC 5 | 53 |
| Cancel data | CAN | 24 |
| Cancel double-strike printing | ESC H | 72 |
| Cancel double-width by line | DC4 | 20 |
| Cancel double-width printing (lines) | ESC W | 87 |
| Cancel emphasized printing | ESC F | 70 |

Printing in Color

The IBM Personal Computer Color Printer is capable of printing in 8 colors when the process color ribbon is used. The 4 colors of the ribbon are selected by: ESC b (Select Band 4) for black, ESC c (Select Band 3) for cyan, ESC m (Select Band 2) for magenta, and ESC y (Select Band 1) for yellow. You can print four additional colors, orange, green, violet, and brown, by printing the data twice. Print the data in one color and then print over the data in a second color according to the table below. When printing data twice to mix colors, always print the lighter color first to avoid contaminating the ribbon.

Color Desired Ribbon Bands to Mix

| Orange | Bands 1 (ESC y) and 2 (ESC m) |
|--------|-------------------------------|
| Green | Bands 1 (ESC y) and 3 (ESC c) |
| Violet | Bands 2 (ESC m) and 3 (ESC c) |
| Brown | Bands 2 (ESC m) and 4 (ESC b) |

To mix colors, data must be sent to the printer in the following order: printer control code to select the first color, data to be printed, carriage return with no line feed, printer control code to select the second color, repeat the data to be printed. For example, to print "IBM Personal Computer" in green, you must; select band 1 (yellow) with ESC y, print "IBM Personal Computer", return the carriage with no line feed with ASCII decimal value 141 from "Character Set 1," select band 3 (cyan) with ESC c, and print "IBM Personal Computer." To do this, type the following:

LPRINT CHR\$(27);CHR\$(121);"IBM Personal Computer";CHR\$(141);CHR\$(27);CHR\$(99;)"IBM Personal Computer"

Note: The above example is for use with "Character Set 1."

DIP-Switch Settings

Many of the printer functions can be manually set with a 10-position dual in-line package (DIP) switch. Although these same functions are programmable, the printer defaults to the values set by the DIP switch.

The DIP switches must be set prior to switching the printer's power to On. The printer logic reads the DIP-switch settings only at power-on or printer initialization.

Note: Some programs use the control codes in Character Set 1 that have ASCII decimal values above 128. These control codes are not in Character Set 2. The use of Character Set 2, therefore, may not give the desired results with some programs.

The charts on the following page describe the functions available through the DIP-switch settings.

Location of Printer DIP Switch

| Switch | Setting | Function |
|--------|---------|---|
| 1 | On | Selects Character Set 2 (see "Character Set 2")(see "Note" below) |
| 1 | Off | Selects Character Set 1 (see "Character Set 1") |
| 2 | On | Sets line spacing to 8 lines per inch |
| 2 | Off | Sets line spacing to 6 lines per inch |
| 3 | On | Sets automatic 1-inch perforation skip |
| 3 | Off | No automatic perforation skip |
| 4 | On | Sets automatic line feed on carriage return |
| 4 | Off | No automatic line feed on carriage return |
| 5 | On | Sets printer to a 13.2-inch print line |
| 5 | Off | Sets printer to an 8-inch print line. |
| 6 | On | Selects 12-inch page length |
| 6 | Off | Selects 11-inch page length |
| 7 | On | Sets automatic ribbon-band shift (use with all-black ribbon) |
| 7 | Off | No automatic ribbon-band shift (use with color) |
| 8 | On | Does not allow audible alarm to sound |
| 8 | Off | Allows audible alarm to sound |

DIP-Switch Settings — 1 Through 8

| Switch 9 | Switch 10 | Quality and Spacing Set |
|----------|-----------|--|
| Off | Off | Data processing quality, 12 characters per inch, (see ''Note'' below) |
| Off | On | Data processing quality, 10 characters per inch |
| On | Off | Text quality, 10 characters per inch |
| On | On | Near letter quality, 10 characters per inch |

DIP-Switch Settings — 9 and 10

Switches 9 and 10 select the printing quality and character spacing. See "ESC I" in "Printer Control Codes" for a description of the printing qualities.

Note: When switches 9 and 10 are Off, the printer prints with a 1-inch page length with no perforation skip. Switches 3 and 6 are overridden. This is the self-test setup.

Interface

Specifications:

- Data transfer rate: 1000 CPS (max.)
- Synchronization: By externally supplied STROBE pulses.
- Handshaking: -ACKNLG or +BUSY signals.
- Logic level: Input data and all interface control signals are TTL-compatible.
- Connector type: 57-30360 (AMPHENOL), or equivalent, 36-pin connector on printer end of cable.

Data Transfer Sequence:

Printer Specifications (Part 2 of 2)

Connector Pin Assignments

Printer connector-pin assignments and descriptions of signals are provided in the following chart.

| Connector Pin Assignment | | | |
|--------------------------|--------------------|---|--|
| ignal Pin No. | Signal | Description | |
| 1 | -STROBE | -STROBE pulse to read data in. Pulse width must be more than 0.5µs at receiving terminal. The signal level is normally high (logical 1); data is read at the low (logical 0) level. | |
| 2 | DATA 1 | These signals represent | |
| 3 | DATA 2 | information of the 1st | |
| 4 | DATA 3 | to 8th bits of parallel | |
| 5 | DATA 4 | data respectively. | |
| 6 | DATA 5 | | |
| 7 | DATA 6 | | |
| 8 | DATA 7 | | |
| 9 | DATA 8 | | |
| 10 | -ACKNLG | Approx. 0.5μ s pulse. A low signal indicates that the printer is ready to accept other data. | |
| 11 | + BUSY | A high signal indicates that the printer cannot receive data. The signal becomes high in the following cases: 1. During data entry 2. During printing operation 3. In offline state 4. During printer error status | |
| 12 | + PE | A high signal indicates that the printer is out of paper. | |
| 13 | + SLCT (ENABLE) | A high signal indicates that the remote control select feature has not deselected the printer. The signal level goes high upon going ready or receiving a DC 1 (SELECT). If currently ready but deselected, it goes low upon receiving a DC 3 (DESELECT). | |
| 14 | -AUTO FEED | Not used | |
| 15 | | Not used | |
| 16 | 0v | Logic GND level. | |

Connector Pin Assignment (Part 1 of 2)

| Connector Pin Assignment | | |
|--------------------------|----------------|--|
| Signal Pin No. | Signal | Description |
| 17 | CHASSIS GND | Printer chassis ground (GND). In the printer, the chassis GND and the logic GND are isolated from each other. |
| 18 | | Not used |
| 19-30 | GND | TWISTED-PAIR RETURN logic GND level. |
| 31 | -INIT | When the level of this signal becomes low, the printer controller is reset to its initial state, and the print buffer is cleared. This signal is normally at high level, and its pulse width must be more than 50 µs at the receiving terminal. |
| 32 | -ERROR | The level of this signal becomes low when the printer is in: 1. Paper Out state 2. Offline state 3. Error state |
| 33 | GND | TWISTED-PAIR return logic GND level. |
| 34 | | Not used |
| 35 | | Not used |
| 36 | | Not used |

Connector Pin Assignment (Part 2 of 2)

Notes:

- 1. All interface conditions are based on TTL-level signals. The rise and fall time of each signal must be less than 0.2 microseconds.
- 2. Data must not be transmitted until the -ACKNLG signal and +BUSY signal go low.
